AgentKit

Local-First AI Agent Starter Kit

5 production n8n workflows. No coding. No cloud bills.

START HERE

Your 15-minute setup guide. Read this first.

Welcome!

You now own five production-ready AI agents that run on YOUR infrastructure. A Telegram assistant with memory, a content repurposer, an AI lead qualifier, a daily news researcher, and a support bot that never hallucinates. Your data stays local. Your costs stay near zero.

What's inside

- workflows/ -- 5 import-ready n8n JSON workflows (the product)
- In-canvas setup guides: pink sticky notes inside every workflow
- CONFIG nodes: every setting lives in ONE node per workflow
- CONFIG.md -- every field explained. README.md -- architecture + upgrade paths.
- LICENSE-COMMERCIAL.md -- your commercial license (this purchase)

What you need (honest list)

- n8n (free) -- self-hosted or n8n Cloud, v2.x recommended.
- AI: Ollama running locally (FREE, private) OR an OpenAI API key (pay-per-use, cents per run).
- Telegram bot token from @BotFather (free) -- for workflows 01, 02, 04, 05.
- A Google account + one Sheet -- for memory, logs, FAQ knowledge base.
- No coding. If you can click, you can run this.

Setup in 6 steps (15 minutes)

Step 1: Import a workflow

n8n: Workflows > Import from File > pick any agentkit-*.json. Read the pink sticky note first -- it walks you through that workflow's setup.

Step 2: Set up Ollama (free AI) or OpenAI

Ollama: install from ollama.com, run 'ollama pull llama3.1'. In the workflow's CONFIG node, ai_base_url = http://localhost:11434/v1. Prefer OpenAI? ai_base_url = https://api.openai.com/v1 and paste your key in ai_api_key.

Step 3: Create your Telegram bot

Message @BotFather on Telegram -> /newbot -> copy the token. In n8n credentials, create a Telegram credential. Attach it to the Telegram nodes.

Step 4: Create your Google Sheet

One Sheet per the CONFIG fields (tabs: memory, log, leads, digests, faq -- only what you use). First row = column headers exactly as CONFIG.md shows. Paste the Sheet ID into CONFIG.

Step 5: Fill the CONFIG node

Open the CONFIG node -- it's the ONLY node you must edit. Replace every YOUR_... placeholder. Get your Telegram chat ID by messaging @userinfobot.

Step 6: Activate and test

Click Active (top right). Send your bot a Telegram message / trigger the workflow. Watch it run node by node the first time -- then let it work.

Your 5 agents

- 01 Telegram AI Assistant -- chat with memory. Change system_prompt for a new personality.
- 02 Content Repurposer -- Telegram: /repurpose <topic> -> 4-platform pack in ~60 sec.
- 03 Lead Qualifier -- point your website form at the webhook; hot leads hit Telegram instantly.
- 04 Daily Researcher -- 8 AM digest of your RSS feed, in English or Roman Urdu.
- 05 Support Bot -- answers ONLY from your FAQ sheet. Unknown? Sends your fallback contact.

Pro tips

- Start with ONE workflow (01 is the most fun). Master it, then add the rest.
- The AI prompts inside each HTTP node are yours to rewrite -- tune them to your voice.
- Keep FAQ sheets under 50 rows for sharp answers (workflow 05).
- Sheets are your database AND your audit trail -- check the logs weekly.

Support

Stuck? Email support is included. Describe which workflow + step you're on and what you see; reply within 48 hours.

Love it? A Gumroad rating helps massively. Thank you -- now go build.
